

Bit
Arrays

Suppose You Want a
Array / List of 0/1 values

0	0	1	0	1	1	1	0	1	0	1	1	0	1	1	1
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Suppose You Want a
Array / List of 0/1 values

0	0	1	0	1	1	1	0	1	0	1	1	0	1	1	1
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

For example, you want to store a
set of small positive integers

$$\{2, 4, 5, 6, 8, 10, 12, 13, 15\}$$

What about a List?

What about a List?

Lets make a list to store 1000 values:

What about a List?

Lets make a list to store 1000 values:

$L = [0 \text{ for } i \text{ in range 1000}]$ (or $L = [0] * 1000$)

What about a List?

Lets make a list to store 1000 values:

$L = [0 \text{ for } i \text{ in range 1000}]$ (or $L = [0] * 1000$)

How big is L?

What about a List?

Lets make a list to store 1000 values:

$L = [0 \text{ for } i \text{ in range 1000}]$ (or $L = [0] * 1000$)

How big is L?

16,056 Bytes = 128,448 Bits

What about a List?

Lets make a list to store 1000 values:

$L = [0 \text{ for } i \text{ in range 1000}]$ (or $L = [0] * 1000$)

How big is L?

16,056 Bytes = 128,448 Bits

To store 1000 Bits!!

What about a List?

Lets make a list to store 1000 values:

$L = [0 \text{ for } i \text{ in range 1000}]$ (or $L = [0] * 1000$)

How big is L?

16,056 Bytes = 128,448 Bits

To store 1000 Bits!!

Can we do better?

Python
Low-level Arrays

Python
Lists

Python Low-level Arrays

Can only hold one kind of data which must be specified in advance (e.g. byte, float)

Python Lists

Can hold anything

Python Low-level Arrays

Can only hold one kind of data which must be specified in advance (e.g. byte, float)

Compact

Python Lists

Can hold anything

Big

Python Low-level Arrays

Fast

Python Lists

Can hold anything

Big
Slow

Python Low-level Arrays

Can only hold one kind of data which must be specified in advance (e.g. byte, float)

Compact

Fast

Limited Features

Python Lists

Can hold anything

Big

Slower

Can do many things

Creating a low-level Array of Bytes

A = array.array ("B", initial values)

Creating a low-level Array of Bytes

A = array.array ("B", initial values)

Code that means

Byte ~ 8 bits

i.e. 0..255

Bitarray

It should work like this:

Bitarray

It should work like this:

$B = \text{BitArray}(10)$

Bitarray

It should work like this:

B = BitArray(10)
B[3] = 1 \nwarrow size

Bitarray

It should work like this:

B = BitArray(10)
B[3] = 1 ↑ size
B[7] = 1

Bitarray

It should work like this:

B = BitArray(10)
B[3] = 1 ↑ size

B[7] = 1

Print(B[7], B[8])

1 0

Bitarray

It should work like this:

B = BitArray(10)

B[3] = 1 ↑ size

B[7] = 1

Print(B[7], B[8])

1 0

Print(str(B))

0001000100

Bytes to Bits

The smallest array data type supported
is a byte = 8 bits.

Bytes to Bits

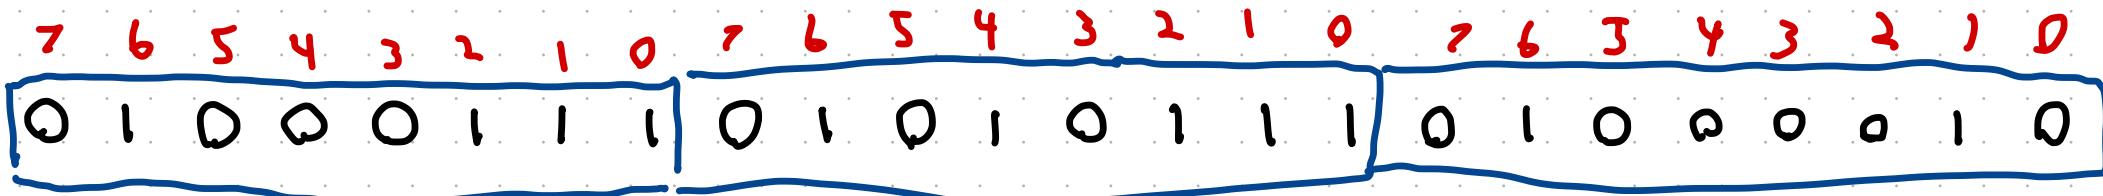

The smallest array data type supported is a byte = 8 bits.

We need to do a little work to make a class where we can read/write individual bits.

$A[0]$

$A[1]$

$A[2]$

Where would we keep the $2^{2^{\text{nd}}}$ Bit?

In the 6^{th} Bit of the 2^{nd} Byte

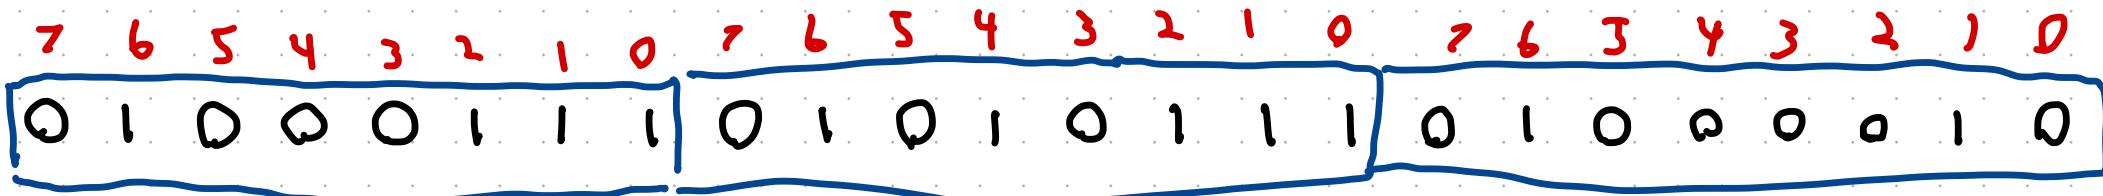

$$22 \bmod 8$$

$$\left\lfloor \frac{22}{8} \right\rfloor$$

$A[0]$

$A[1]$

$A[2]$

Where would we keep the $2^{2^{\text{nd}}}$ Bit?

In the 6^{th} Bit of the 2^{nd} Byte

$$22 \bmod 8$$

$$\left\lfloor \frac{22}{8} \right\rfloor$$

How do we set this value?

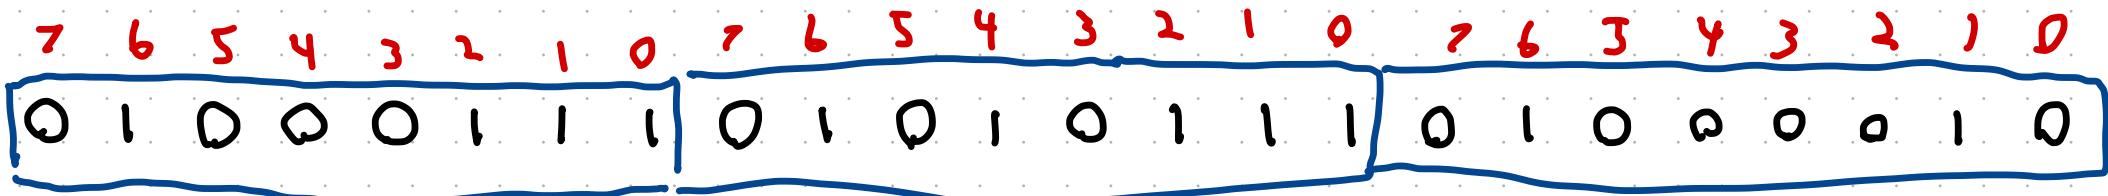

3rd Byte

$A[0]$

$A[1]$

$A[2]$

Where would we keep the 22nd Bit?

In the 6th Bit of the 2nd Byte

$$22 \bmod 8$$

$$\left\lfloor \frac{22}{8} \right\rfloor$$

How do we set this value?

3rd Byte

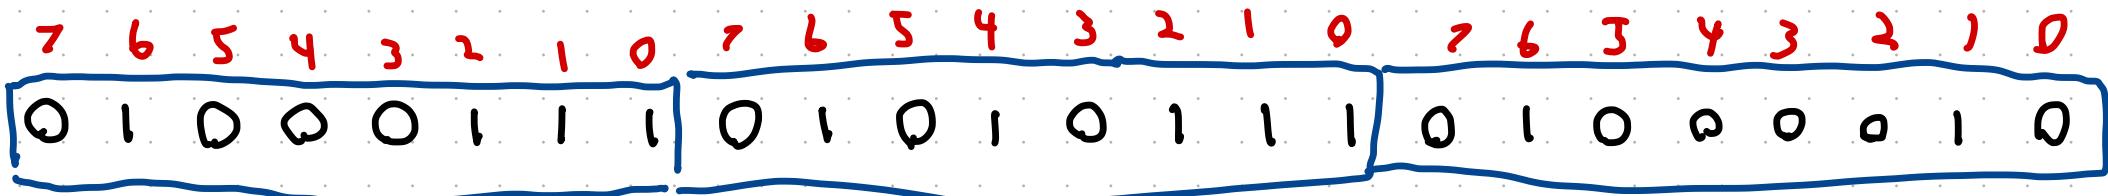

Shift right 6

$A[0]$

$A[1]$

$A[2]$

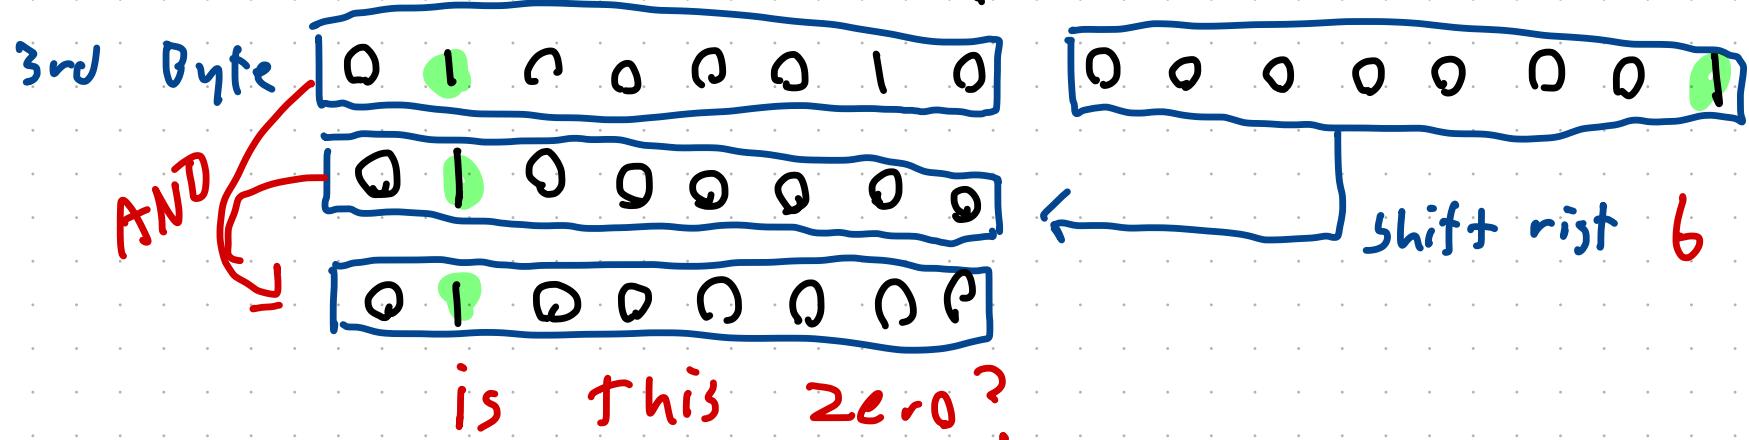

Where would we keep the $2^{2^{\text{nd}}}$ Bit?

In the 6^{th} Bit of the 2^{nd} Byte

$\lfloor \frac{22}{8} \rfloor$

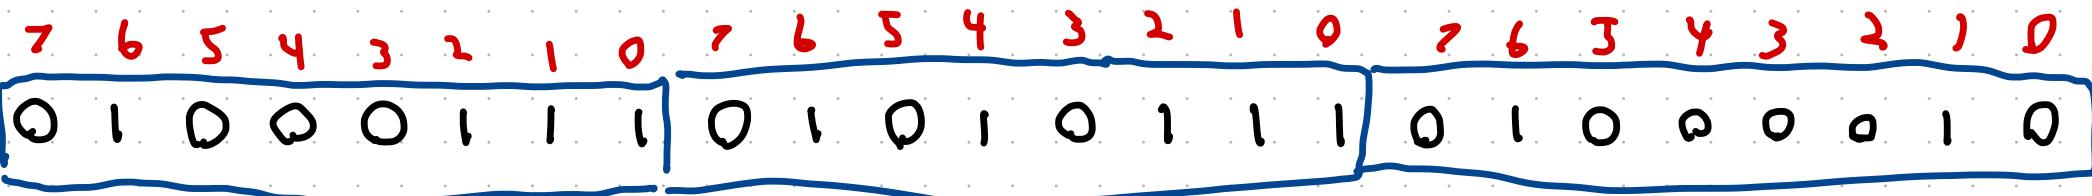

How do we set this value?

$A[0]$

$A[1]$

$A[2]$

Python

Where would we keep the 22nd Bit?

In the 6th Bit of the 2nd Byte

6th

$$\begin{array}{l} \text{22 mod 8} \\ \boxed{\frac{22}{8}} \end{array}$$

1

$$\boxed{\frac{22}{8}}$$

$\boxed{22 \text{ } // \text{ } 8}$

How do we set this value?

$A[3]$

3rd Byte

01000010

00000001

AND

01000000

01000000

←

Shift right 6

$1 << 6$

is this zero?
